

Please add the following new claims:

---

--27. (New) A variation detecting apparatus according to Claim 1 or 2, further comprising:

Ac means by which an operator referring to said area of said reference line drawing/image including said ground objects and said area of said target image including said ground objects displayed by said displaying means inputs a judgement result as to whether there are variations in said ground objects or not.

28. (New) A variation detecting method according to Claim 18, wherein:

in said display mode in which an area of said reference line drawing/image including said ground objects and an area of said target image including said ground objects can be compared with each other, said areas are displayed in overlap with each other or placed adjacently to each other.--

---

#### REMARKS

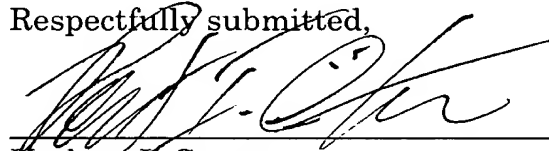

The Examiner is respectfully requested to enter this amendment before examining the claims. Claims 4, 8, 13, 17, 19, 21, and 22 have been amended merely to correct their dependency and to provide antecedent basis for some elements of the claims. No new matter has been introduced. New claims 27 and 28 have been inserted corresponding to claims 4 and 19, respectively, but with different dependency.

If there are any questions regarding this amendment or the application in general, a telephone call to the undersigned would be appreciated since this should expedite the prosecution of the application for all concerned.

If necessary to effect a timely response, this paper should be considered as a petition for an Extension of Time sufficient to effect a timely response, and please charge any deficiency in fees or credit any overpayments to Deposit Account No. 05-1323 (Docket #2254/50641).

February 7, 2002

Respectfully submitted,

Herbert I. Cantor

**APPENDIX**  
**IN THE CLAIMS**

Please amend claims 4, 8, 13, 17, 19, 21, and 22 as follows:

4. (Amended) A variation detecting apparatus according to [any one of Claims 1 through] Claim 3, further comprising:

means by which an operator referring to said area of said reference line drawing/image including said ground objects and said area of said target image including said ground objects displayed by said displaying means inputs a judgement result as to whether there are variations in said ground objects or not.

8. (Amended) A variation detecting apparatus according to Claim 7, further comprising:

means for manually setting said switching period with which said transparent state is changed automatically every predetermined time.

13. (Amended) A variation detecting apparatus according to [any one of Claims] Claim 1 [through 12], wherein:

when there are a plurality of ground objects which can be judged to have variations or ground objects which cannot be judged as to whether there are variations or not, areas including said ground objects are displayed sequentially automatically or manually.

17. (Amended) A variation detecting method for detecting variations in ground objects in one and the same area between a line drawing map describing profile lines of said ground objects or an image obtained by picking up said ground objects (hereinafter referred to as “reference line drawing/image”) from above and an image obtained by picking up said ground objects in the same

area from above later on (hereinafter referred to as “target image”), comprising [the steps of]:

collating said reference line drawing/image with said target image so as to obtain variation indexes indicating whether there are variations or not in said ground objects respectively; and

displaying ground objects which can be judged to have variations or ground objects which cannot be judged as to whether there are variations or not on the basis of said variation indexes, in a display mode in which an area of said reference line drawing/image including said ground objects and an area of said target image including said ground objects can be compared with each other.

19. (Amended) A variation detecting method according to Claim 17 [or 18], wherein:

in said display mode in which an area of said reference line drawing/image including said ground objects and an area of said target image including said ground objects can be compared with each other, said areas are displayed in overlap with each other or placed adjacently to each other.

20. (Amended) A storage medium having a program stored therein [and associated] for use with a variation detecting method according to any one of Claims 17 through 19, or 28.

21. (Amended) A variation detecting system comprising a variation detecting apparatus and a center apparatus, for detecting variations of ground objects between a reference line drawing/image composed of a line drawing/image map describing profile lines of said ground objects or an image obtained by picking up said ground objects from above and a target image

obtained by picking up said ground objects in the same area from above later on, said center apparatus including:

a storage unit for storing said reference line drawing/image and said target image; and

means for providing one or both of said reference line drawing/image and said target image stored in said storage unit to said variation detecting apparatus issuing a request, through a communication line or a medium in response to said request issued by said variation detecting apparatus;

said variation detecting apparatus including:

means for collating said reference line drawing/image with said target image, both said images being supplied from said center apparatus, so as to obtain variation indexes indicating whether there are variations or not in said ground objects respectively; and

means for displaying ground objects which can be judged to have variations or ground objects which cannot be judged as to whether there are variations or not on the basis of said variation indexes, in a display mode in which an area of said reference line drawing/image including said ground objects and an area of said target image including said ground objects can be compared with each other.

22. (Amended) A variation detecting system comprising a variation detecting apparatus and a center apparatus, for detecting variations of ground objects between a reference line drawing/image composed of a line drawing/image map describing profile lines of said ground objects or an image obtained by picking up said ground objects from above and a target image

obtained by picking up said ground objects in the same area from above later on, said center apparatus including:

a first storage unit for storing said reference line drawing/image and said target image;

a second storage unit for storing a processing program for detecting variations of ground objects;

means for providing one or both of said reference line drawing/image and said target image stored in said first storage unit to said variation detecting apparatus issuing a request, through a communication line or a medium in response to said request issued by said variation detecting apparatus; and

means for providing said processing program stored in said second storage unit to said variation detecting apparatus issuing a request, through a communication line or a medium in response to said request issued by said variation detecting apparatus;

said variation detecting apparatus including:

means for collating said reference line drawing/image with said target image on the basis of said reference line drawing/image, said target image and said processing program provided by said center apparatus so as to obtain variation indexes indicating whether there are variations or not in said ground objects respectively; and

means for displaying ground objects which can be judged to have variations or ground objects which cannot be judged as to whether there are variations or not on the basis of said variation indexes, in a display mode in which an area of said reference line drawing/image including said ground objects

and an area of said target image including said ground objects can be compared with each other.
